Frequently Asked Questions

- **Q: What is the difference between transmission (TSO) connected and distribution (DSO) connected wind?**

A: The power grid consists of two parts, a transmission system (high voltage power lines) and a distribution system (medium and low voltage power lines into homes and businesses).

The transmission system is operated by EirGrid also known as the Transmission System Operator (TSO).

The distribution system is operated by ESB Networks also known as the Distribution System Operator (DSO).

Windfarms connected to the transmission system are known as TSO-connected windfarms.

Likewise, windfarms connected to the distribution system are known as DSO-connected windfarms.

Currently the TSO and DSO publish two separate lists of TSO-connected and DSO-connected windfarms and all other types of generators as well.

- **Q: What is the difference between the Maximum Export Capacity (MEC) and the installed capacity?**

A: Prior to building a windfarm, a connection agreement must be signed with the grid operator (TSO or DSO). This connection agreement specifies the maximum allowable power that can be exported by the windfarm to the grid, known as the Maximum Export Capacity (MEC). The grid operator then upgrades that part of the network to cater for this new capacity. The installed capacity of the windfarm increases as the turbines are gradually built. The table on page 1 shows both the agreed MEC and the latest installed capacity of the windfarm and whether it is fully or partially connected. The installed capacities of a windfarm may be slightly higher than its MEC, but the power output is limited so that it would not exceed this agreed MEC.

- **Q: Why is the number of turbines not available for certain windfarms?**

A: This is the case for partially connected windfarms.

This information may not be available until these windfarms are fully connected.

- **Q: Why do the connected MW and dates in the table on page 1 not match the MW growth in the annual/monthly charts and tables that follow?**

A: Once a large windfarm is first energised, it can take a number of months for the installed capacity to grow as the turbines are gradually built and commissioned. The table on page 1 only shows the final connection date for a windfarm if it is fully connected and shows the latest “capacity increase” date for a windfarm if it is partially connected. The following charts and tables however reflect the gradual growth accurately.
