## **1. Introduction**

To enable the efficient and secure operation of the system, generation is dispatched to certain levels to prevent equipment overloading, voltages outside limits or system instability.

The software used to model the system is the Reserve Constrained Unit Commitment (RCUC).

#### **1.1 Document Objective**

The objective of the Operational Constraints Update is to present the key system and generator constraints which are included in the scheduling process (i.e. in the RCUC software). The most common operational constraints that are modelled are:

- North South tie-line export / import constraint: MWR type
- Moyle import / export constraint: MW type
- Requirement to keep a minimum number of units on in an area: NB type
- Requirement to limit the output of the generators in an area to limit short circuit levels or overloads: MW type or NB type
- Requirement for a minimum output from the generators in an area to support the voltage or to avoid overloads: MW type or NB type
- Requirement to limit the output of stations due to fish spawning: MW type

This document comprises of: (i) **Operational Reserve Requirements**, and (ii) **System Constraints**.

### 1.2 List of Terms

|     | ТСС Туре   |  |  |  |  |  |  |  |  |  |
|-----|--|--|--|--|--|--|--|--|--|--|
| MW  | MW Limit MW output of unit or units assigned to a TCG                                |  |  |  |  |  |  |  |  |  |
| MWR | WR Limits (the total MW + Primary Reserve - the area demand) from assigned resources |  |  |  |  |  |  |  |  |  |
| NB  | IB Limit to the status (On/Off) of the unit or units assigned to a TCG               |  |  |  |  |  |  |  |  |  |

|   | Limit Flag  |  |  |  |  |  |  |  |  |
|---|---|--|--|--|--|--|--|--|--|
| Е | Equality Constraint (generation = load)                           |  |  |  |  |  |  |  |  |
| Х | Export Constraint - limit output of a group of units <= max limit |  |  |  |  |  |  |  |  |
| Ν | Import Constraint - limit output of a group of units >= min limit |  |  |  |  |  |  |  |  |
| В | In-between Constraint; >= min and <= max                          |  |  |  |  |  |  |  |  |

# 2. Operating Reserve Requirements

The following tables show the operating reserve requirements on an all-island basis and in each jurisdiction.

| Category         | All Island Requirement<br>% Largest In-Feed | Ireland Minimum <sup>1</sup><br>(MW) | Northern Ireland<br>Minimum (MW) |
|------------------|---|--------------------------------------|----------------------------------|
| POR <sup>2</sup> | 75%   | 110 / 75                             | 50                               |
| SOR              | 75%   | 110 / 75                             | 50                               |
| TOR 1            | 100%  | 110 / 75                             | 50                               |
| TOR 2            | 100%  | 110 / 75                             | 50                               |

1. Ireland Lower values apply from 00:00 - 07:00 inclusive

2. Minimum values of POR in each jurisdiction must be supplied by dynamic sources

### **2.1 Operating Reserve Definitions**

|                   | Delivered By | Maintained Until |
|-------------------|--------------|------------------|
| Primary (POR)     | 5 seconds    | 15 seconds       |
| Secondary (SOR)   | 15 seconds   | 90 seconds       |
| Tertiary 1 (TOR1) | 90 seconds   | 5 minutes        |
| Tertiary 2 (TOR2) | 5 minutes    | 20 minutes       |

#### **2.2 Source of Reserve**

|   | Ireland   | Northern Ireland                     |  |  |  |  |
|---|---|--------------------------------------|--|--|--|--|
| Dynamic Reserve   | Synchronised Generating Units   |                                      |  |  |  |  |
| Static Reserve  | Turlough Hill Units when in<br>pumping mode<br>Interruptible Load:<br>Standard provision: 45MW (07:00<br>– 00:00)<br>EWIC Interconnector (up to<br>100MW) | Moyle Interconnector<br>(up to 50MW) |  |  |  |  |
| Negative Reserve  | 100MW   | 50MW                                 |  |  |  |  |
| (Defined as the MW output of<br>a conventional generator<br>above its minimum load) |   |                                      |  |  |  |  |

## 3. System Constraints

#### **3.1 Tie Line Limits**

Tie line flows in both directions have physical limits, the maximum flow that can be sustained without breaching system security rules (line overloads, voltage limits etc.) after a credible transmission or generation event. The limits are referred to as the Total Transfer Capacity (TTC) comprising of two values: N-S and S-N. When determining minimum system cost, RCUC respects the TTC values by not allowing the sum of the reserve holding in either jurisdiction and the tie line flow to exceed the TTC.

#### **3.2 Non-Synchronous Generation**

To ensure the secure, stable operation of the power system, it is necessary to limit the level of nonsynchronous generation of the system. The System Non-Synchronous Penetration (SNSP) is a measure of the non-synchronous generation on the system at an instant in time i.e. the non-synchronous generation and net interconnector imports as a percentage of the demand and net interconnector exports (where "Demand" includes pump storage consumption when in pumping mode).

#### **3.3 Permanent System Constraint Tables**

The following tables set out the system constraints:

- Active System Wide Constraints;
- Active Northern Ireland Constraints, and
- Active Ireland Constraints.

Note that the limits specified in each table represent the normal intact transmission network limit. These limits may vary from time to time due to changing system conditions.

# 3.3.1 Active System Wide Constraints

| Name                              | TCG<br>Type | Limit<br>Type | Limit  | Resources  | Description  |
|-----------------------------------|-------------|---------------|--|--|--|
| Inter-Area Flow                   | MWR         | X:<=          | 400 MW<br>(There is a<br>margin of<br>20MW on this<br>limit for<br>system<br>safety) | Ireland and<br>Northern<br>Ireland<br>Power<br>Systems | Ensures that the total MW<br>transferred between Ireland and<br>Northern Ireland does not exceed<br>the limitations of the North-South tie<br>line. It takes into account the<br>rescue/reserve flows that could<br>occur immediately post fault<br>inclusive of operating reserve<br>requirements.<br>This is required to ensure the limits<br>of the existing North South tie line<br>are respected. |
| Inter-Area Flow                   | MWR         | X:<=          | 450 MW<br>(There is a<br>margin of<br>20MW on this<br>limit for<br>system<br>safety) | Ireland and<br>Northern<br>Ireland<br>Power<br>Systems | Ensures that the total MW<br>transferred between Northern<br>Ireland and Ireland does not exceed<br>the limitations of the North-South tie<br>line. It takes into account the<br>rescue/reserve flows that could<br>occur immediately post fault<br>inclusive of operating reserve<br>requirements.<br>This is required to ensure the limits<br>of the existing North South tie line<br>are respected. |
| Non-<br>Synchronous<br>Generation |             | X:<=          | 50%  | Wind,<br>MOYLE,<br>EWIC                                | Ensures that the SNSP is kept below 50%.   |
| Operational<br>Limit for<br>RoCoF |             | X:<=          | 0.5 Hz/s   | Ireland and<br>Northern<br>Ireland<br>Power<br>Systems | Ensures that RoCoF does not exceed 0.5 Hz/s.   |
| Operational<br>Limit for Inertia  |             | N:>=          | 20,000 MWs   | Ireland and<br>Northern<br>Ireland<br>Power<br>Systems | Ensures that All Island Inertia does not fall below 20,000 MWs.  |

## **3.3.2 Active Northern Ireland Constraints**

| Name                       | TCG        | Limit        | Limit   | Resources  | Description   |
|----------------------------|------------|--------------|---|--|---|
| System<br>Stability        | Type<br>NB | Type<br>N:>= | 3 Units at all times  | C30, B31,<br>B32, B10,<br>BPS4,<br>BPS5,<br>BPS6, K1,<br>K2                  | There must be at least 3 high-inertia<br>machines on-load at all times in<br>Northern Ireland. Required for dynamic<br>stability.   |
| Replacement<br>Reserve     | MW         | X:<=         | 211 MW  | AGU<br>IPOWER,<br>CGT8,<br>BGT1,<br>BGT2,<br>KGT1,<br>KGT2,<br>KGT3,<br>KGT4 | Combined MW output of OCGTs must<br>be less than 211MW (out of a total of<br>311MW) in Northern Ireland at all<br>times.100MW Required for replacement<br>reserve   |
| North West<br>Generation   | NB         | N:>=         | 0 or 1 Unit<br>depending<br>on NI<br>system<br>demand                                     | C30  | Coolkeeragh must be on load when the<br>NI system demand exceeds 1000 MW.<br>This operational constraint is required to<br>ensure voltage stability in the northwest<br>of Northern Ireland and to prevent<br>possible system voltage collapse above<br>the indicated system demand.  |
| Kilroot<br>Generation      | NB         | N:>=         | 1 or 2 Units<br>depending<br>on NI<br>system<br>demand                                    | K1, K2   | There must be at least one Kilroot unit<br>on load when the NI system demand<br>exceeds 1400 MW and 2 units are<br>required above 1550 MW. This<br>operational constraint is required to<br>ensure voltage stability in the Belfast<br>area and to prevent the requirement for<br>an inter area flow reduction in a post<br>fault scenario. |
| Ballylumford<br>Generation | MW         | X:<=         | 1344 MW<br>Dec - Feb,<br>1174 MW<br>Mar - Nov   | B31, B32,<br>B10, BGT1,<br>BGT2, B4,<br>B5, B6                               | The output from Ballylumford Power<br>Station must be limited seasonally due<br>to a circuit rating limitation.<br>The unused capacity from Moyle is<br>transferred to Ballylumford, until Moyle<br>returns to full availability.   |
| Moyle<br>Interconnector    | MW         | В            | -295 <mw<br>&lt;450<br/>Current<br/>restriction is<br/>-254<mw<br>&lt;247</mw<br></mw<br> | Moyle<br>Interconnec<br>tor  | This applies to all units registered as<br>Moyle Interconnector units. It ensures<br>that all flows do not exceed an import of<br>450MW to Northern Ireland and an<br>export of 295MW to Scotland. This is<br>required to ensure that the limits are<br>respected.<br>Current restriction is due to one pole<br>being unavailable.          |

# **3.3.3 Active Ireland Constraints**

| Name                       | ТСС Туре | Limit<br>Type | Limit  | Resources   | Description  |
|----------------------------|----------|---------------|--|---|--|
| System<br>Stability        | NB       | N:>=          | 5 Units  | AD1, AD2,<br>DB1, HNC,<br>HN2, MP1,<br>MP2, MP3,<br>PBC, TB3,<br>TB4, TYC,<br>WG1 | There must be at least 5 high-inertia<br>machines on-load at all times in Ireland.<br>Required for dynamic stability.  |
| Replacement<br>Reserve     | MW       | X:<=          | 493 MW   | AT11, AT12,<br>AT14, ED3,<br>ED5, MRC,<br>NW5, RP1,<br>RP2, TP1,<br>TP3           | Combined MW output of OCGTs must<br>be less than 493MW (out of a total of<br>793MW) in Ireland at all times.<br>Required for replacement reserve. The<br>MW values are subject to change as<br>availability of the units change. |
| Dublin<br>Generation       | NB       | N:>=          | 2 Units  | DB1, HNC,<br>HN2, PBC   | There must be at least 2 large<br>generators on-load at all times in the<br>Dublin area. Required for voltage<br>control. This assumes EWIC is<br>operational.   |
| Dublin<br>Generation       | NB       | N:>=          | 1 Unit if<br>Ireland<br>System<br>Demand<br>>3800<br>MW  | PBC, HNC  | Requirement for PBC <u>or</u> HNC to be on<br>load when the Ireland system demand<br>is greater than 3800 MW. This<br>operational constraint is required for<br>load flow control in the Dublin area.                            |
| Dublin<br>Generation       | NB       | N:>=          | 1 Unit if<br>Ireland<br>System<br>Demand<br>> 4400<br>MW | PBC   | Requirement for PBC to be on load<br>when Ireland System Demand is<br>greater than 4400 MW. This operational<br>constraint is required for load flow<br>control in the Dublin area.  |
| Dublin North<br>Generation | NB       | N:>=          | 1 Unit   | PBC, HNC,<br>HN2  | Requirement for generation in North<br>Dublin (for load flow and voltage<br>control).  |
| Dublin South<br>Generation | NB       | N:>=          | 1 Unit   | PBC, DB1  | Requirement for generation in South<br>Dublin (for load flow and voltage<br>control).  |
| Southwest<br>Generation    | NB       | N:>=          | 2 by night<br>3 by day                                   | AD1, AD2,<br>AT11, AT12,<br>AT14, SK3,<br>SK4, WG1                                | There must be at least 2/3 generators<br>on-load at all times in the South West<br>area. Required for voltage stability.   |
| Cork<br>Generation         | MW       | В             | 0 MW<br><mw<<br>1100 MW</mw<<br>                         | AD1, AD2,<br>AT11, AT12,<br>AT14, MRC,<br>WG1                                     | Generation restriction in the Cork area<br>determined week ahead by Grid<br>Operations NearTime.   |

| South<br>Generation         | MW | В    | 0 MW<br><mw<<br>1800 MW</mw<<br>      | AD1, AD2,<br>AT11, AT12,<br>AT14, MRC,<br>WG1, GI1,<br>GI2, GI3, GI4 | Generation restriction in the Southern<br>Region. This will be determined week<br>ahead by Grid Operations NearTime.  |
|-----------------------------|----|------|---------------------------------------|--|---|
| Moneypoint                  | NB | N:>= | 1 Unit                                | MP1, MP2,<br>MP3   | There must be at least one Moneypoint<br>unit on load at all times. Required to<br>support the 400kV network.   |
| Hydro Smolt<br>Protocol     | NB | N/A  | Varies                                | ER1, ER2,<br>ER3, ER4,<br>LE1, LE2,<br>LE3                           | Over the spring and early summer<br>period as the water temperature in the<br>rivers and lakes change, the hydro<br>stations have to be dispatched in a very<br>specific way to allow fish to move<br>safely. This affects the generators in<br>Erne and Lee.                 |
| EWIC<br>Interconnector      | MW | В    | -526<br><mw<<br>504</mw<<br>          | EWIC<br>Interconnector   | This applies to all units registered as<br>EWIC Interconnector units. It ensures<br>that all flows do not exceed an import of<br>504MW to Ireland and an export of<br>526MW to UK (values taken from<br>Portan). This is required to ensure that<br>the limits are respected. |
| Turlough Hill<br>Generation | MW | В    | >0 MW by<br>day,<br><0 MW by<br>night | TH1, TH2,<br>TH3, TH4  | To ensure required MW running of<br>Turlough Hill.  |

# 4. DS3 Operational Capability Metric Outlook

A briefing paper which informs industry stakeholders of how operational capability metrics for Ireland and Northern Ireland power system are expected to change out to 2020 is located HERE. In particular, it highlights the likely changes to System Non Synchronous Penetration (SNSP[1]) metric.

<sup>&</sup>lt;sup>[1]</sup> SNSP is a real-time measure of the percentage of generation that comes from non-synchronous sources, such as wind and HVDC interconnector imports, relative to the system demand. Version 1.21 January-2015
